

Ecological & Economic Buildings

ACTIV HOME is the first manufacturer of low-carbon building elements from local industrial production, using directly available straw in the form of bales.

Thanks to an innovative patented process, our modules make it possible to build passive houses with a negative carbon balance for the price of a traditional building.

For all builders, developers and investors who wish to develop passive and low carbon buildings

Contact us to implement the process in your area. We will bring you all the necessary expertise to invest in these sustainable constructions.
